Django PDF is a web app used to prove how to create PDF using different libraries: weasyprint , selenium and reportlab . Some conclusions:

- Use weasyprint to create PDF from static content (HTML, CSS).
- Use selenium to create PDF from dynamic content. It handles dynamic Javascript, including React apps, Bootstrap, MUI and ChartsJS. It can also authenticate to external apps.
- Use reportlab to create custom PDF from scratch. Probably the most powerful method, but also the most complex one.

Tech Stack

python pandas postgres   django chartsjs redis   weasyprint bootstrap   selenium reportlab   seaborn
